

"Mono_CD14_THBS1" · Label vs. best GEP (K=23, GEP=1) · Already pure but transient — verify

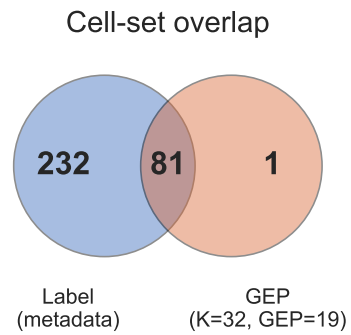

"Mono_CD16" · Label vs. best GEP (K=23, GEP=3) · Already pure but transient — verify

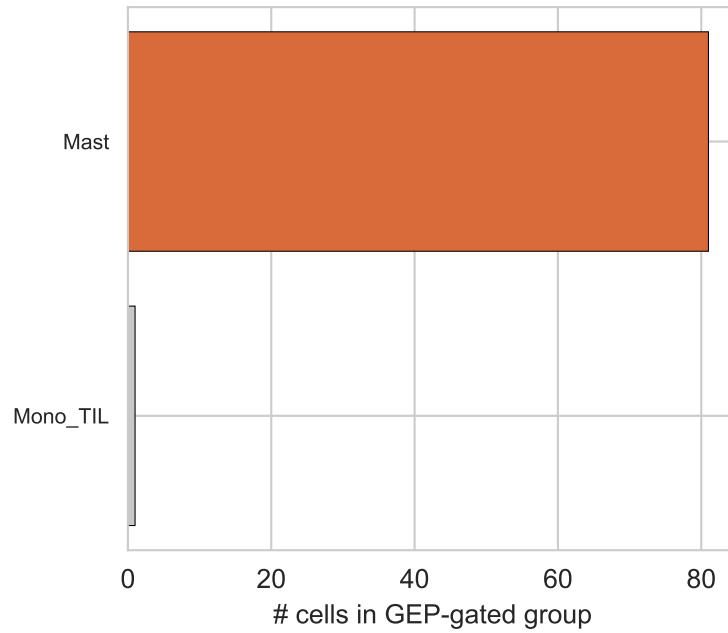

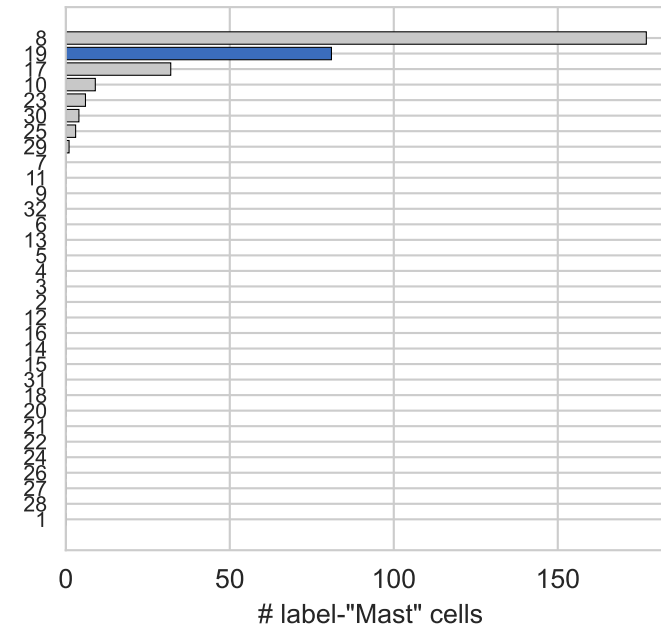

"Mast" · Label vs. best GEP (K=32, GEP=19) · Modest gains from splitting

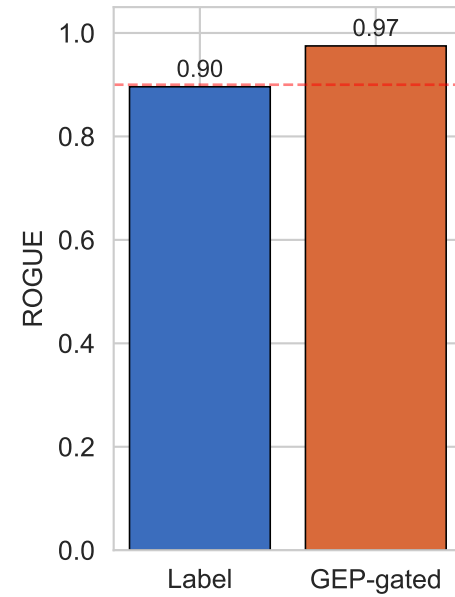

Distribution of 82 cells in GEP=19, K=32 based on their original label
81/82 = 99% are originally "Mast"

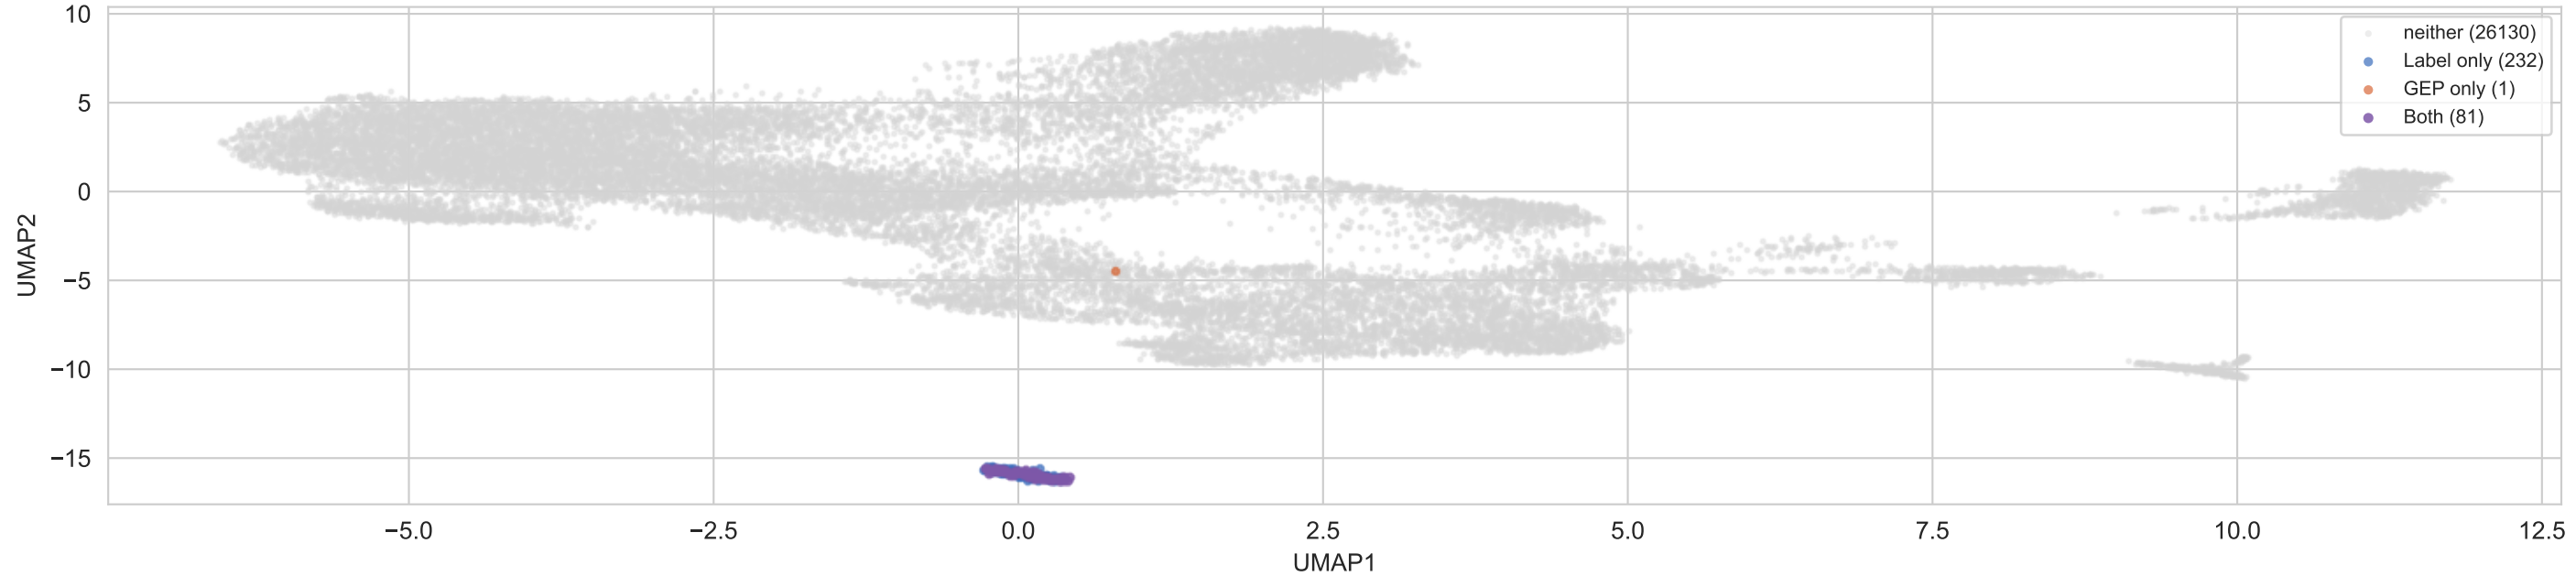

Where label-"Mast" cells go at K=32
81/313 = 26% land in GEP=19

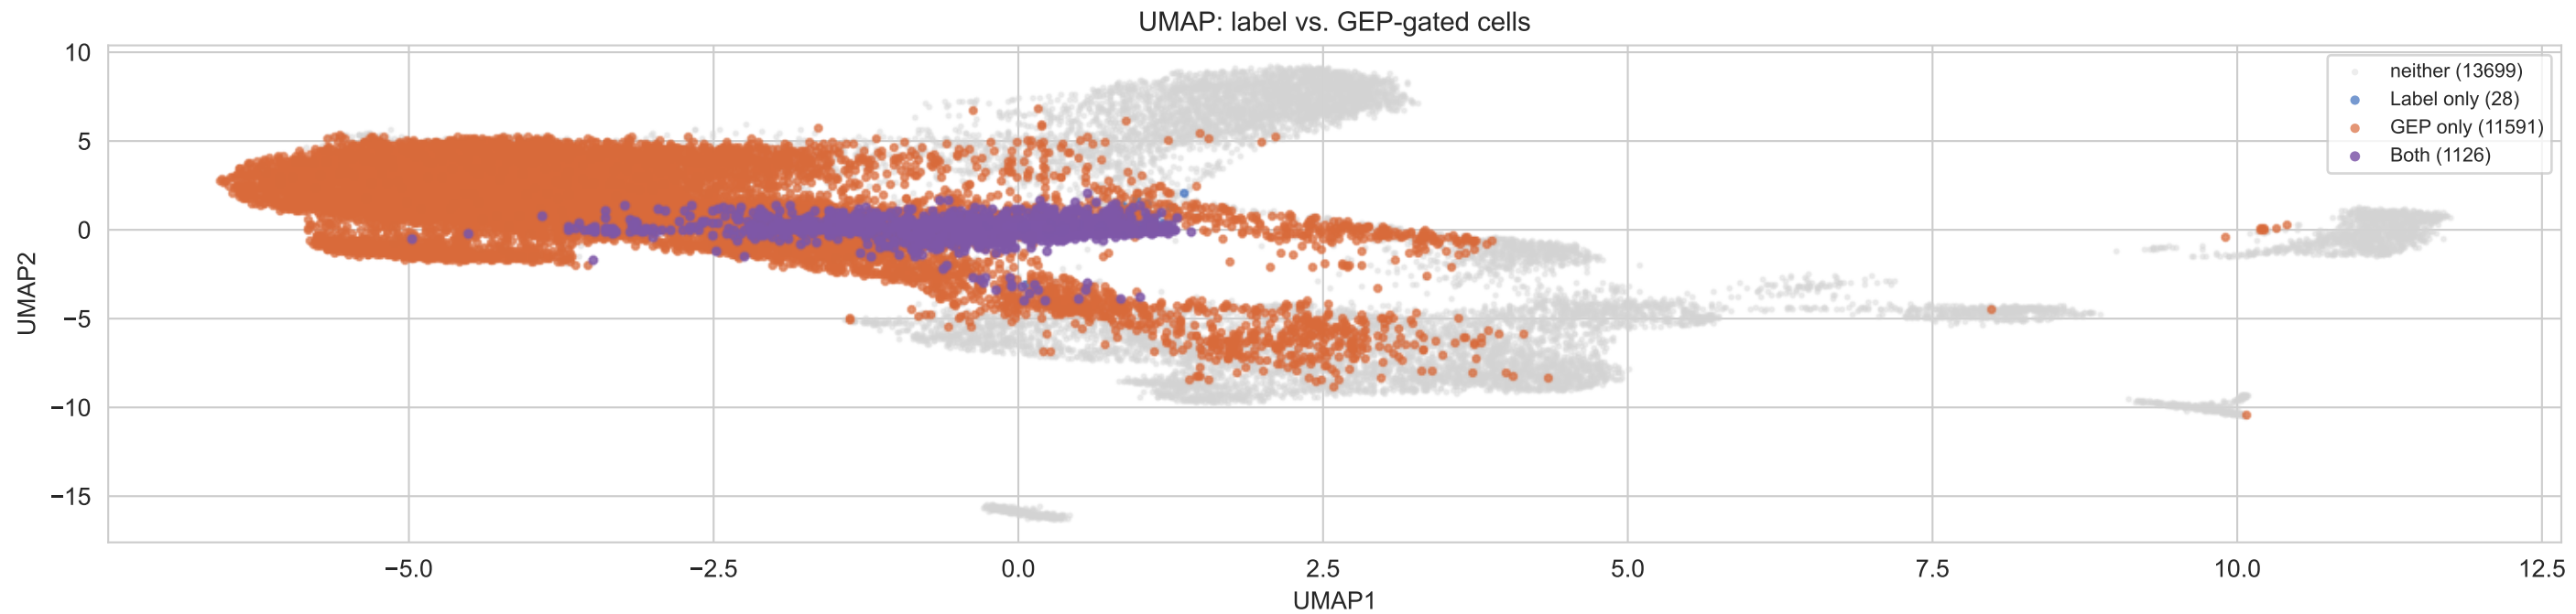

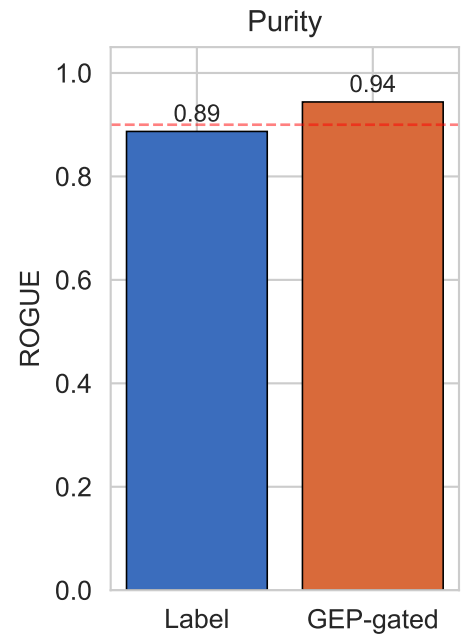

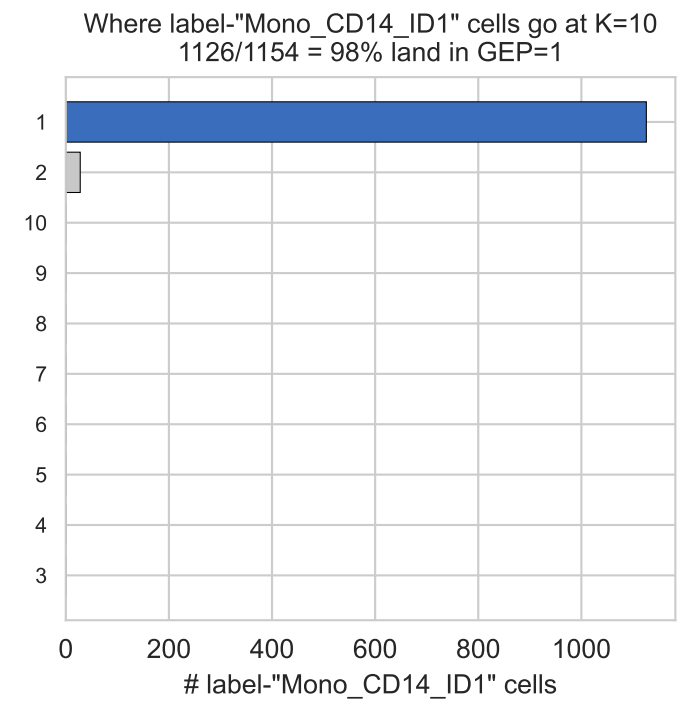

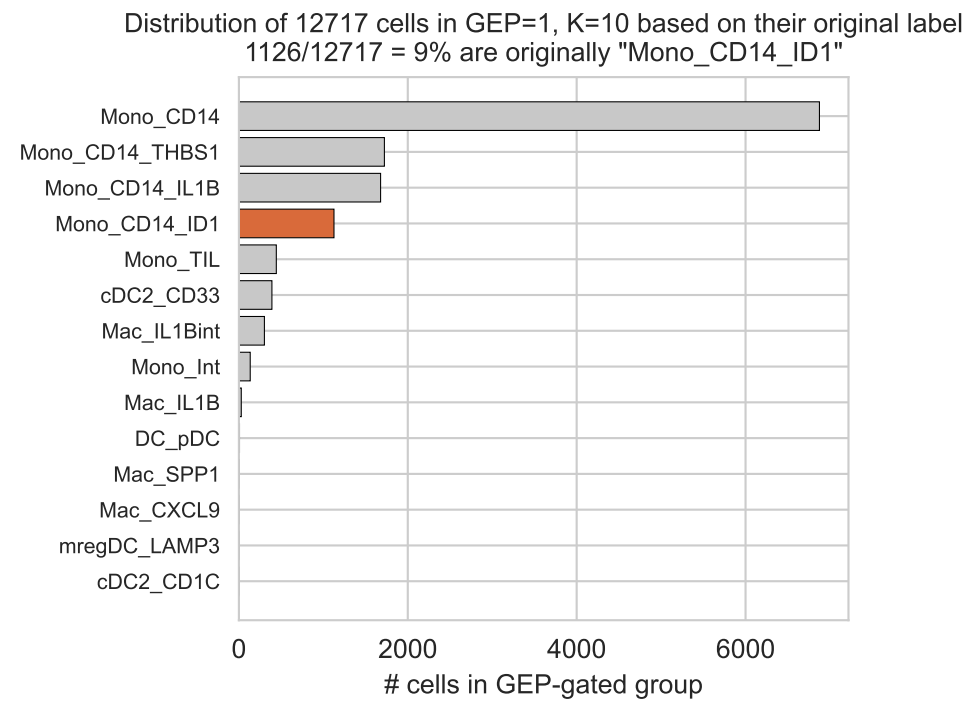

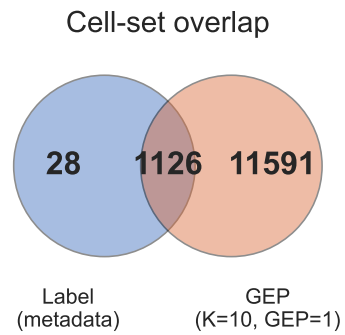

Purity

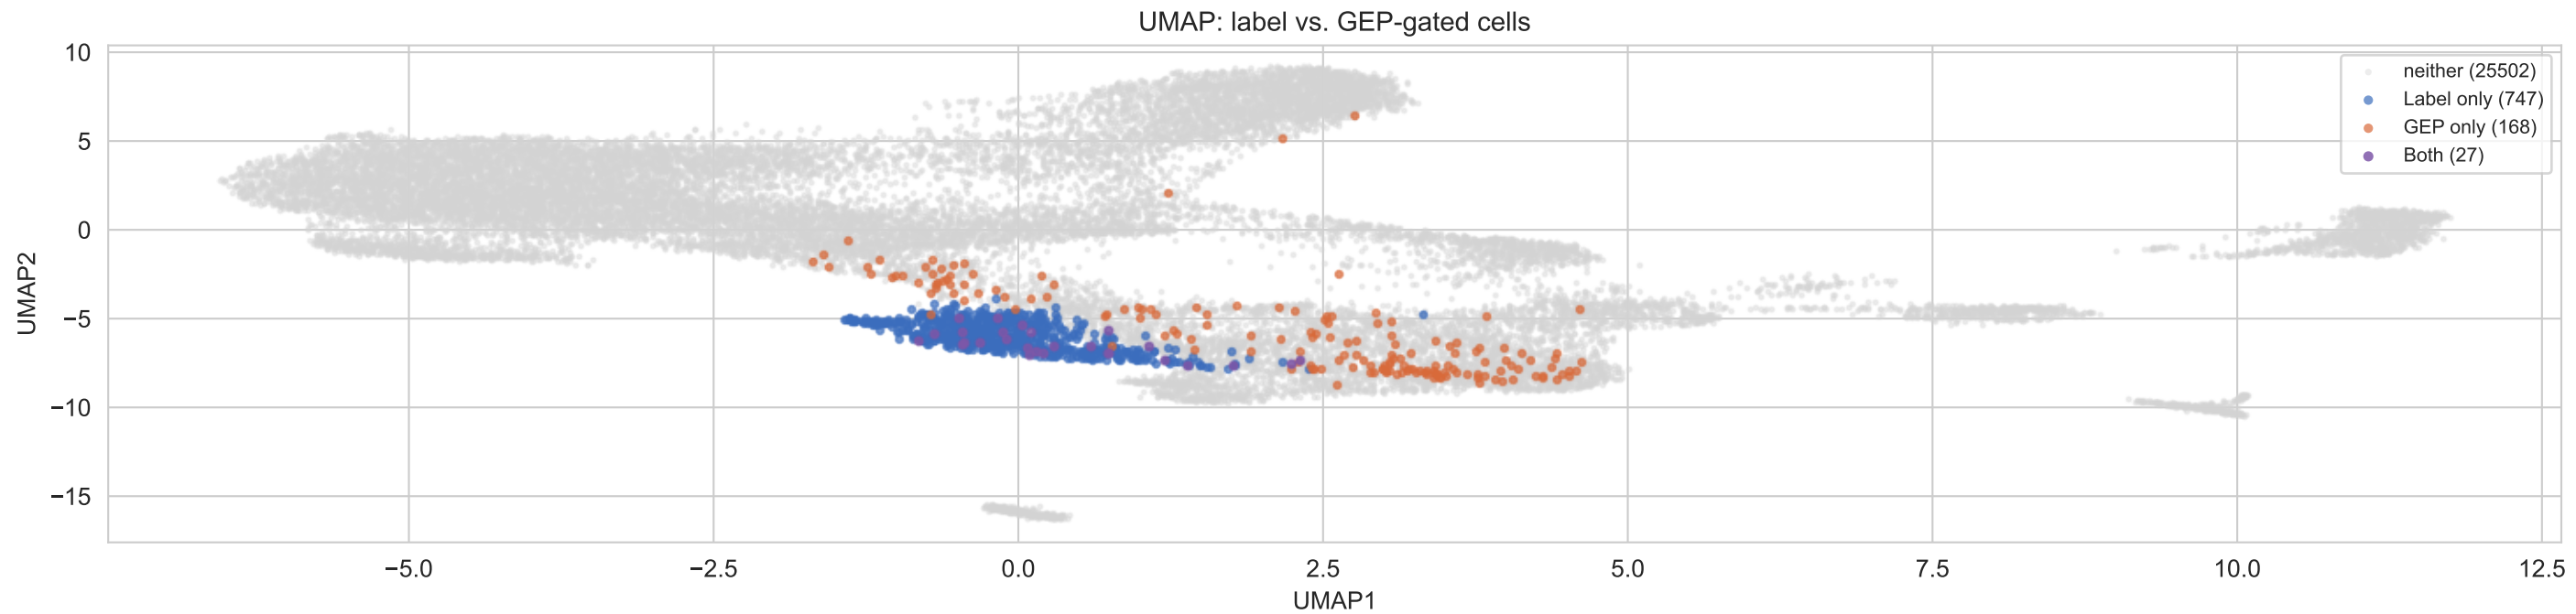

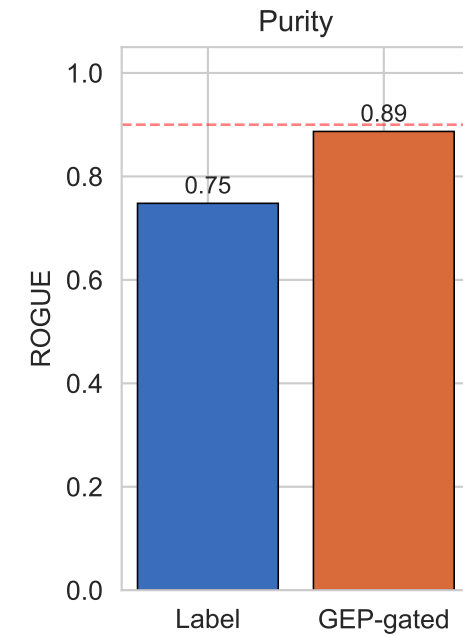

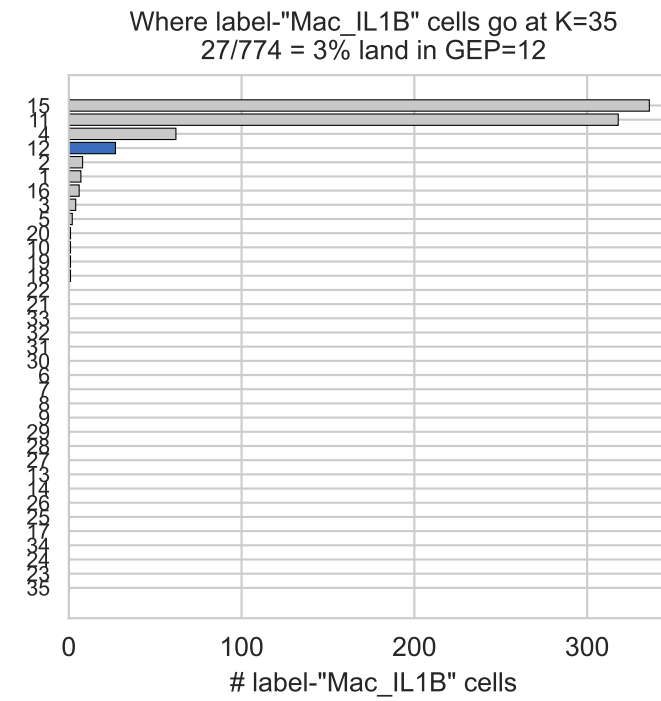

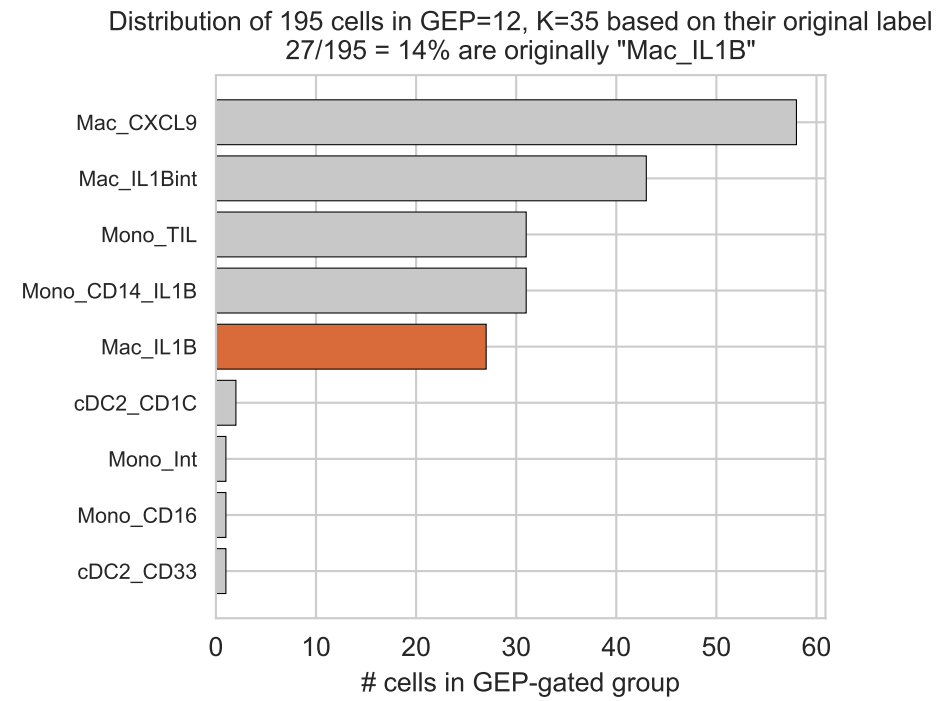

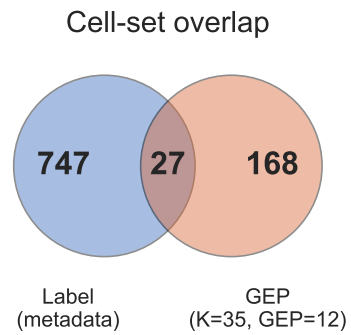

UMAP: label vs. GEP-gated cells

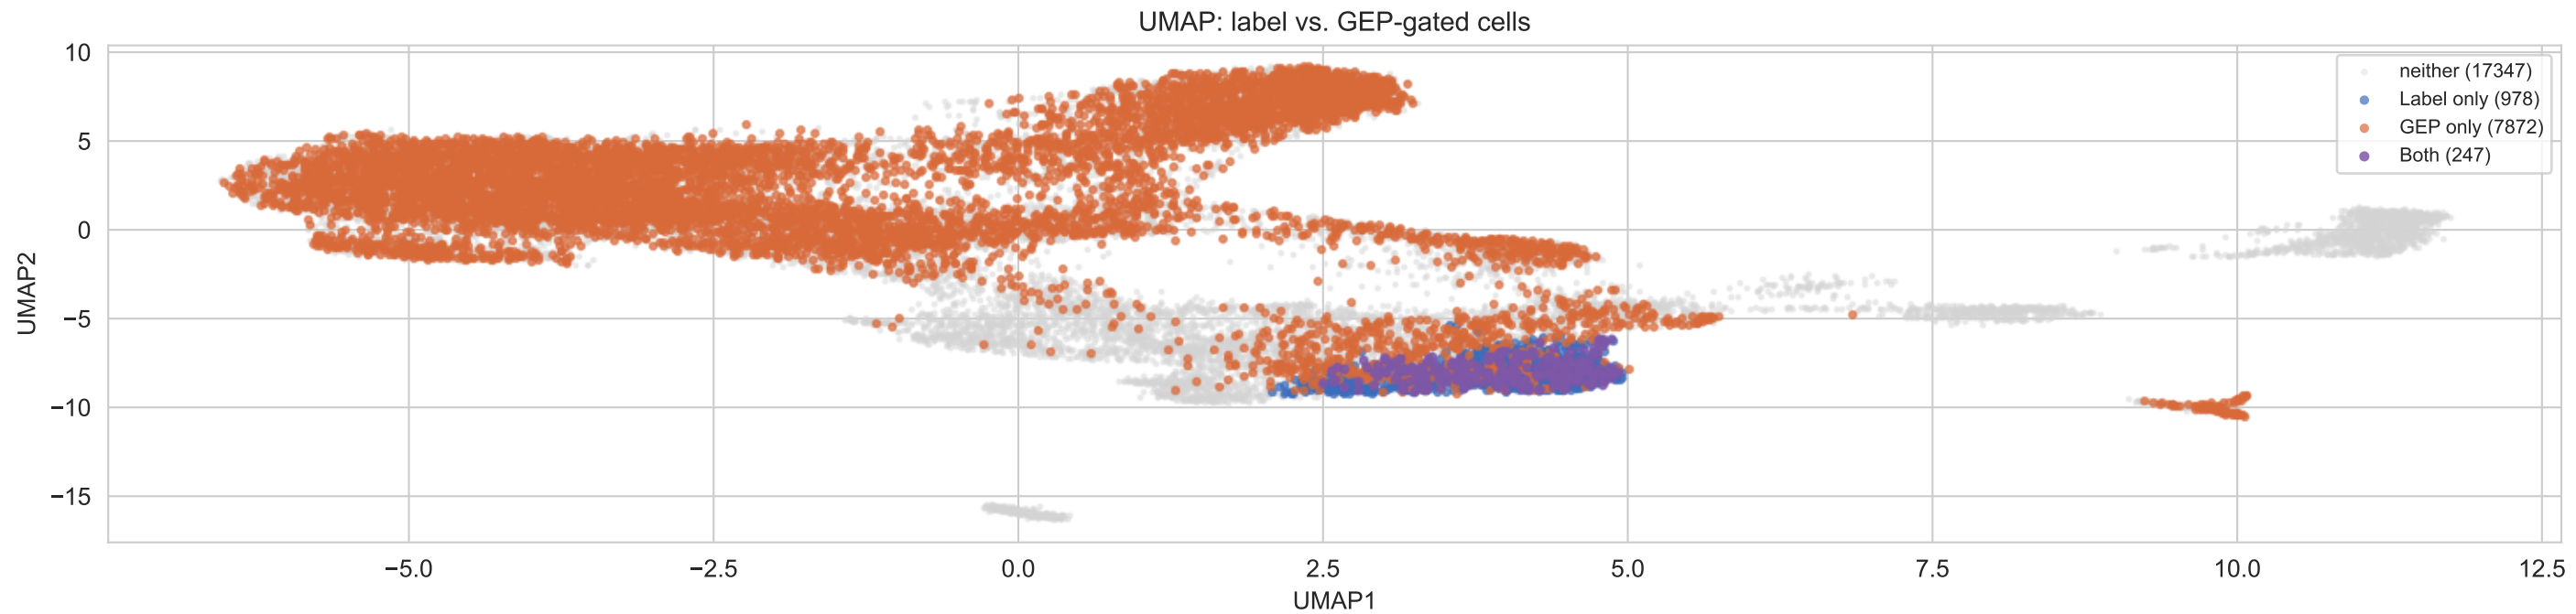

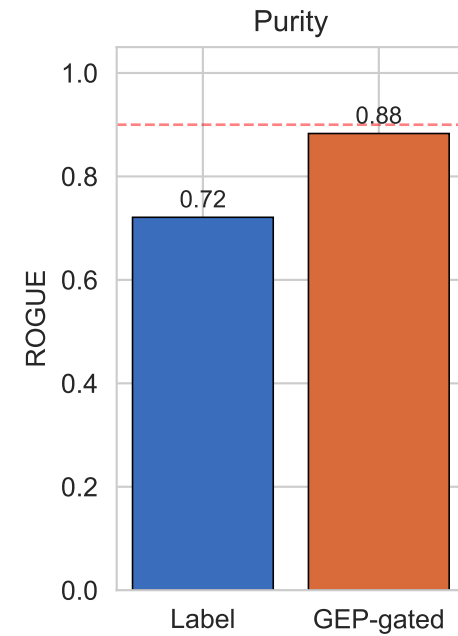

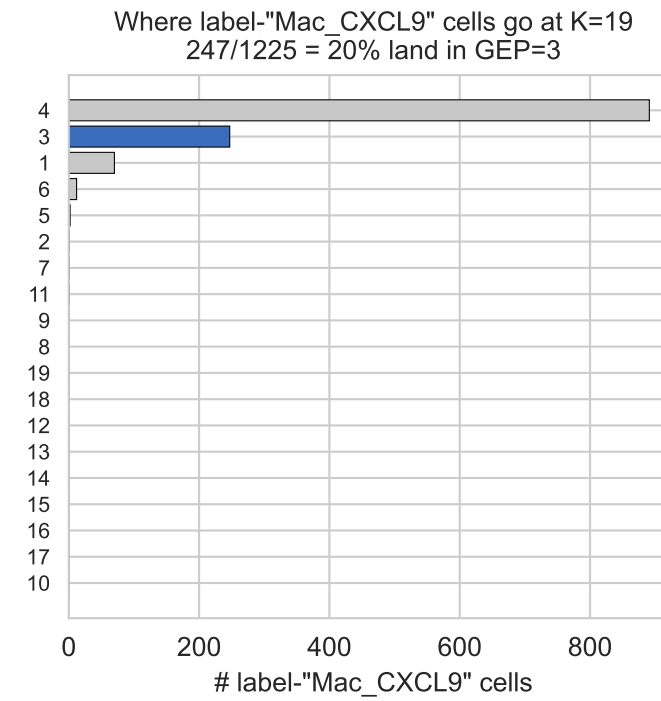

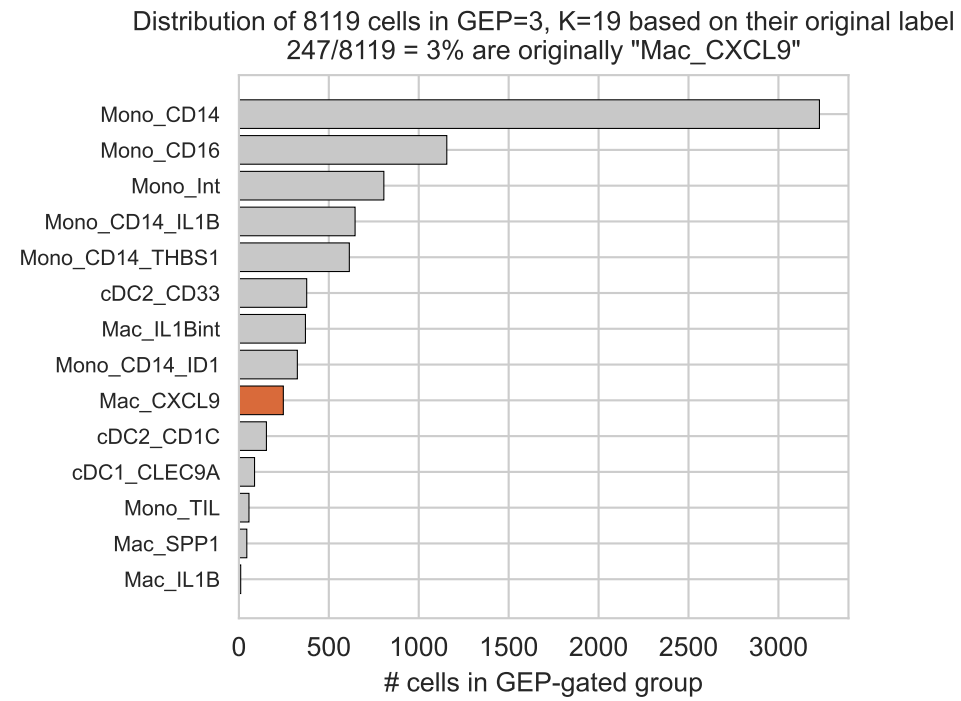

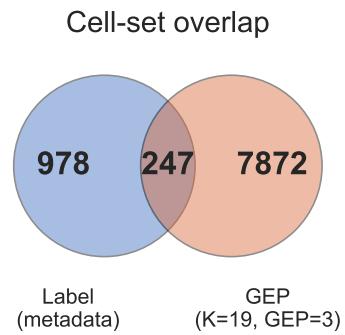

"Mono_CD14_ID1" · Label vs. best GEP (K=10, GEP=1) · Modest gains from splitting

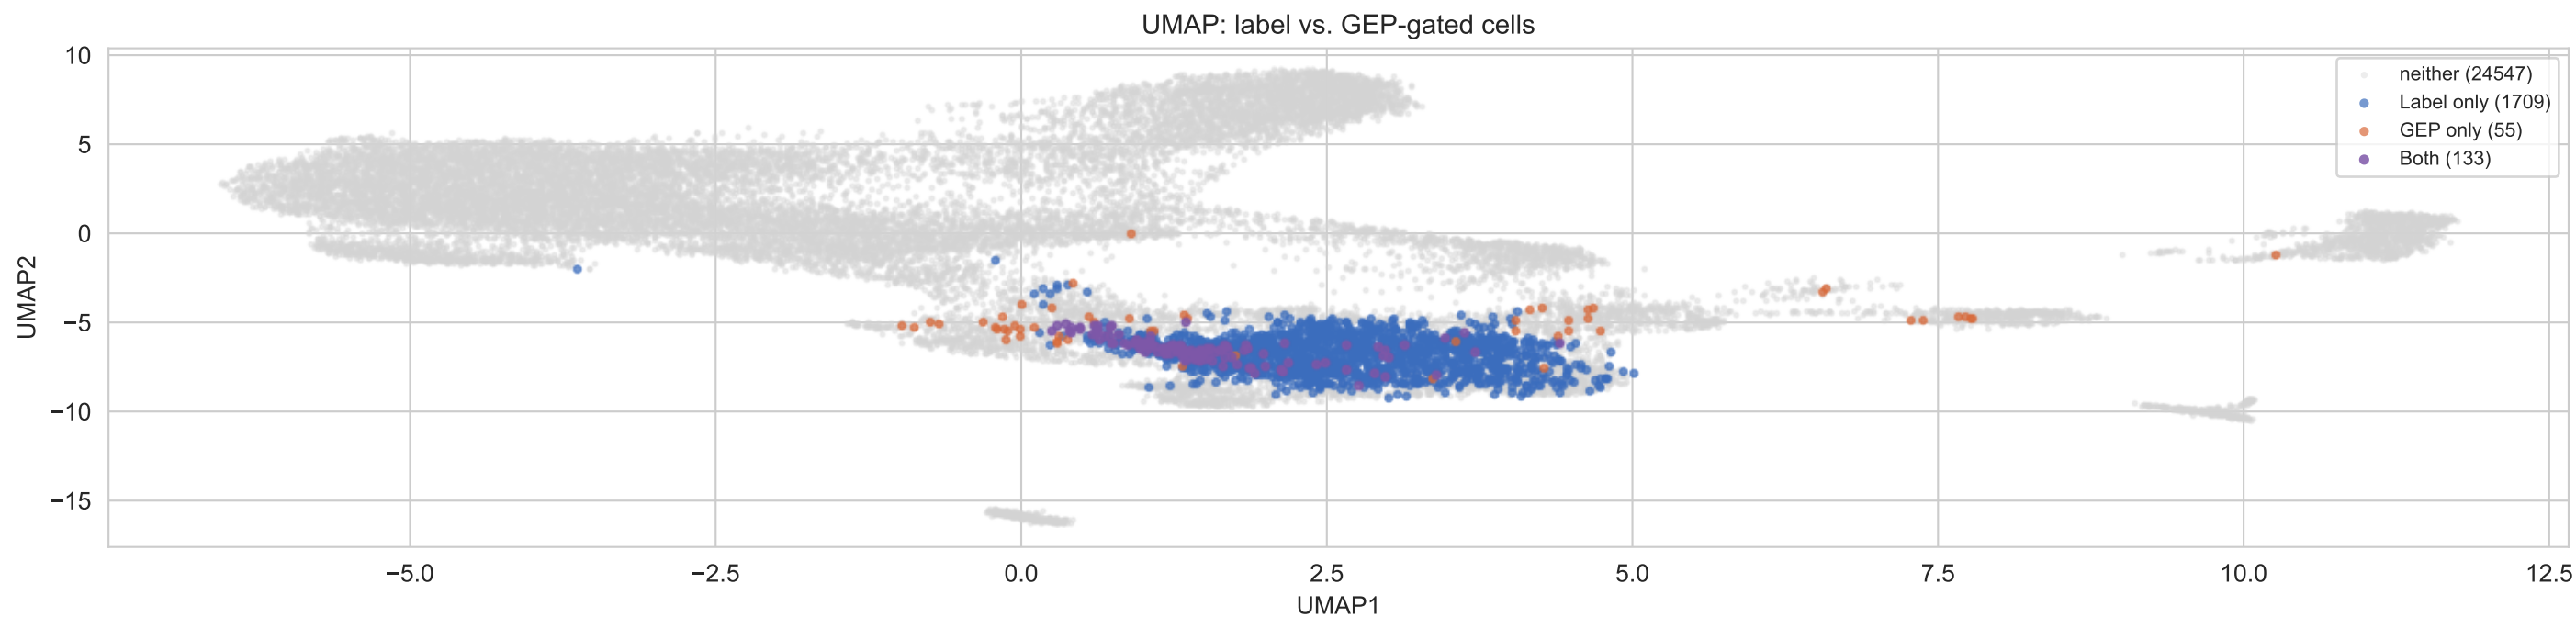

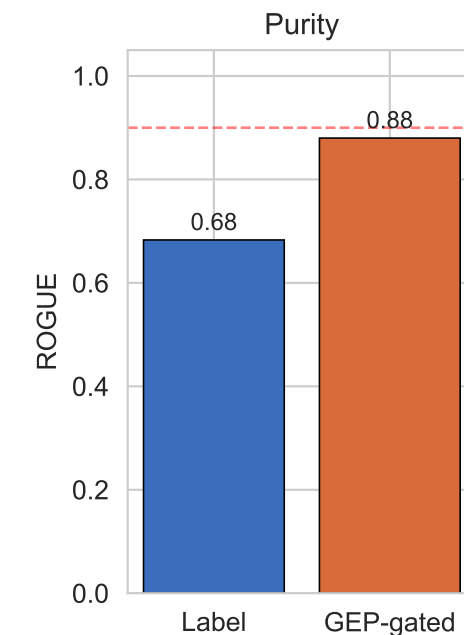

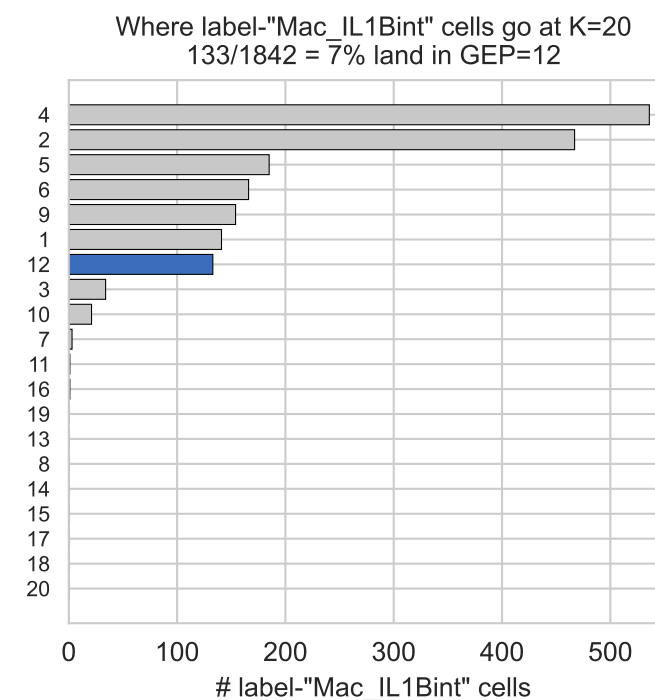

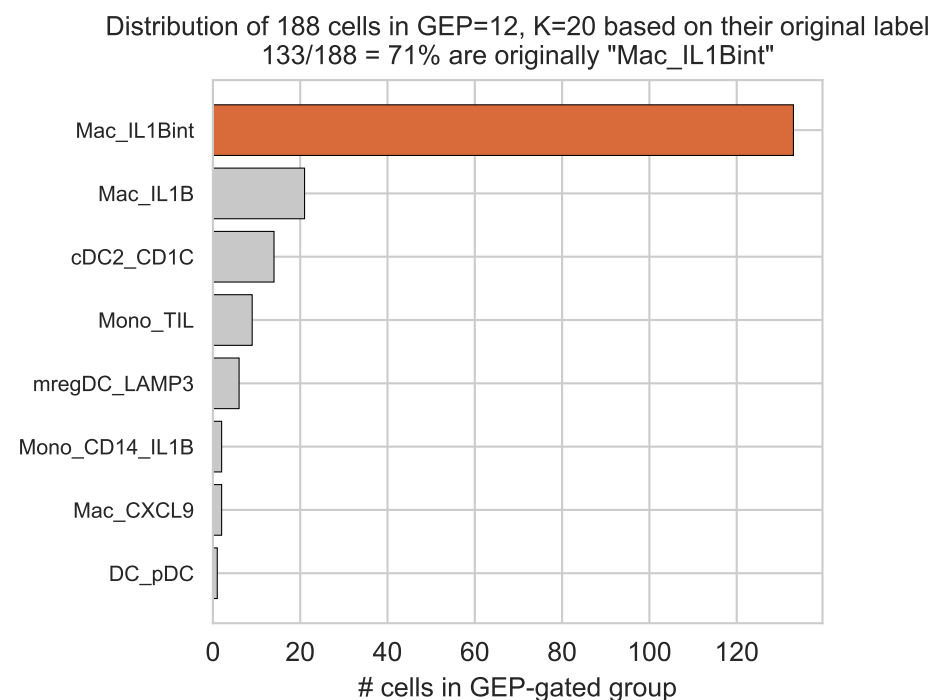

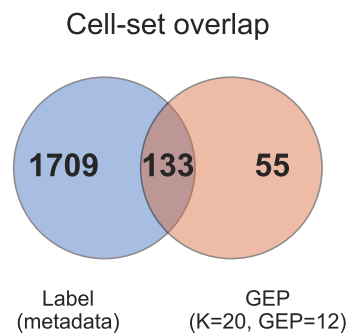

"Mac_IL1B" · Label vs. best GEP (K=35, GEP=12) · Modest gains from splitting

"Mac_CXCL9" · Label vs. best GEP (K=19, GEP=3) · Modest gains from splitting

"Mac_IL1Bint" · Label vs. best GEP (K=20, GEP=12) · Modest gains from splitting

"cDC2_CD1C" · Label vs. best GEP (K=27, GEP=19) · Splitting recovers substructure & persistent — keep going
